Tarefa Aula 2

Scientists create liver cells from patients' skin

Wed, Aug 25 2010
By Kate Kelland

LONDON (Reuters) - Scientists have created liver cells in a lab for the first time using reprogrammed cells from human skin, paving the way for the potential development of new treatments for liver diseases that kill thousands each year.

Cambridge University scientists who reported their results in the Journal of Clinical Investigation on Wednesday, said they also found a way of avoiding the kind of intense political and ethical rows over embryonic stem cells which are currently hampering work in the United States.

"This technology bypasses the need for using human embryos," said Tamir Rashid of Cambridge's laboratory for regenerative medicine, who led the study. "The cells we created were just as good as if we had used embryonic stem cells."

Embryonic stem cells are seen as the most powerful and malleable type of cells but are controversial because they are harvested from human embryos when they are just a few days old.

Responda, em Português, de acordo com o texto:

1- Qual é a vantagem de se usar células da pele humana reprogramadas, criando células do fígado em laboratório?

2- O que está emperrando o trabalho destes cientistas nos EUA?

3- O que há de especial nesta tecnologia, segundo Tamir Rashid?

4- Por que as células tronco embrionárias são tidas como controversas?

Vocabulário

1- liver = fígado
2- skin = pele
3- paving the way = abrindo o caminho
4- avoiding = evitar
5- political and ethical rows = brigas éticas e políticas
6- stem cells = células tronco
7- currently = atualmente
8- hampering = emperrando, travando
9- bypasses = evita
10- led (to lead / led / led) = liderou
11- just as good as = tão boas quanto
12- malleable = maleável
13- harvested = coletadas, colhidas

Embryonic stem cells are seen as the most powerful and malleable type of cells but are controversial because they are harvested from human embryos when they are just a few days old.

Responda, em Português, de acordo com o texto:

1- Qual é a vantagem de se usar células da pele humana reprogramadas, criando células do fígado em laboratório?

Elementos-chave → Pergunta
Resposta

1- A vantagem de se usar tais células é que isto abre o caminho para o potencial desenvolvimento de novos tratamentos para doenças do fígado que matam milhares de pessoas a cada ano.

Como se lê no trecho destacado no texto.

Elementos-chave → Pergunta
Resposta

O que está emperrando este trabalho são as intensas brigas políticas e éticas sobre células tronco embrionárias.

3- O que há de especial nesta tecnologia, segundo Tamir Rashid?

Segundo Tamir Rashid, esta tecnologia evita a necessidade de se usar embriões humanos pois as células que foram criadas por eles eram tão boas quanto teriam sido se tivessem usado células tronco embrionárias.

4- Por que as células tronco embrionárias são tidas como controversas?
Elas são tidas como controversas porque são coletadas a partir de embriões humanos quando ainda têm apenas alguns dias de vida.
